Project Name	Emotion Detection & Learning Support Engine
Maximum Marks	4 Marks

Empathy Map: Emotion Detection & Learning Support Engine

Primary Persona: Student / Online User

Project Context:

Developing an AI-based Emotion Detection & Learning Support Engine that analyzes user text using NLP and Deep Learning to identify emotions and provide supportive, personalized responses for emotional well-being and better learning experience.

THINK & FEEL

What is the user really thinking and feeling?

- “I sometimes feel stressed or confused while studying or chatting online.”
- “I wish someone understood my emotions when I express myself in text.”
- “Can AI really understand how I feel?”
- “I want quick emotional support or motivation when I feel low.”
- “I prefer a system that feels human-like and supportive.”

SEE

What does the user see in their environment?

- Long study hours with pressure and deadlines.
- Social media conversations with mixed emotional tones.
- Lack of emotional support in digital platforms.
- Generic chatbot responses that do not understand feelings.
- Increasing use of AI tools in education and communication.

SAY & DO

What does the user say and do?

- “I’m stressed about exams or projects.”
- “I feel happy/sad but don’t know how to express it properly.”
- Uses chat apps, learning platforms, and AI tools frequently.
- Searches for motivation or mental support online.
- Interacts with chatbots or assistants for help.

HEAR

What does the user hear from others?

- “Stay strong, everyone goes through stress.”
- “You need to manage your time better.”
- “Don’t worry, AI tools can help you learn faster.”
- Feedback from teachers about performance pressure.
- Friends sharing emotional experiences online.

😞 PAIN

What are the user's frustrations?

- Difficulty expressing emotions clearly in text.
- No system understands emotional context properly.
- Lack of personalized emotional support tools.
- Stress during studies or online communication.
- Feeling ignored or misunderstood in digital platforms.

😊 GAIN

What does the user want to achieve?

- Accurate detection of emotions from text input.
- Instant supportive and empathetic AI responses.
- A system that understands mood and provides motivation.
- Better emotional awareness during learning and communication.
- Personalized and intelligent interaction experience.

🔗 How This Maps to Your Project Features

User Need	Solution in Emotion Detection System
Emotion understanding	NLP + Deep Learning model (BERT / LSTM)
Supportive response	AI-generated empathetic replies
Real-time interaction	Streamlit chatbot interface
Learning support	Motivational + guidance responses
Emotion tracking	Session history / logs
Visualization	Dashboard analytics

📌 Use Case Mapping

Use Case	User Problem Addressed	System Feature
Emotion detection from text	Misunderstood feelings	NLP Classification Model
Supportive AI response	Emotional distress	Generative AI response engine
Chat interface	Need for interaction	Streamlit chatbot UI
Emotion tracking	Lack of awareness	Session history storage
Analytics dashboard	Understanding mood trends	Visualization module
